Reducing child mortality in the last mile: a randomized social entrepreneurship intervention in Uganda

Björkman Nykvist, Martina; Guariso, Andrea; Svensson, Jakob; Yanagizawa-Drott, David

Abstract: The delivery of basic health products and services remains abysmal in many parts of the world where child mortality is high. This paper shows the results from a largescale randomized evaluation of a novel “social entrepreneurship” approach to health care delivery. In randomly selected villages a sales agent was locally recruited and incentivized to conduct home visits, educate households on essential health behaviors, provide medical advice and referrals, and sell preventive and curative health products. Results after three years show substantial health impact: under-5 child mortality was reduced by 27% at an estimated cost of 71 peri life – years saved.

Introduction

MDG 4: “Reduce by two-thirds, between 1990 and 2015, the under-five mortality rate”

1990: 91 deaths per 1000 births → 2015: 43 deaths per 1000 births

→ target was missed [New SDG: 25 deaths per 1000 births by 2030]
→ 5.9 million children under-5 died in 2015
   → leading causes: diarrhoea, pneumonia, malaria, birth complications
→ children in SSA more than 14 times more likely to die
Introduction

MDG 4: “Reduce by two-thirds, between 1990 and 2015, the under-five mortality rate”

1990: 91 deaths per 1000 births → 2015: 43 deaths per 1000 births

→ target was missed [New SDG: 25 deaths per 1000 births by 2030]
→ 5.9 million children under-5 died in 2015
    → leading causes: diarrhoea, pneumonia, malaria, birth complications
→ children in SSA more than 14 times more likely to die

More than half of the deaths could be prevented with access to simple, affordable interventions (WHO)
Introduction

CHWs

“Community Health Workers should be members of the communities where they work, should be selected by the communities, should be answerable to the communities for their activities, should be supported by the health system but not necessarily a part of its organization, and have shorter training than professional workers.” (WHO, 1989)

Main advantages:
→ community-based approach
→ compatible with scarcity of qualified health personnel
→ low cost

Main challenge:
→ weak incentives for CHWs
Introduction

CHWs

- Systematic reviews suggest overall positive health impact...

- ...but still (surprisingly) scarce rigorous evidence
  - especially from RCTs (PubMed search)
  - “…admittedly limited in quality and quantity” (Haines et al, 2007),
    “insufficient evidence is available to draw conclusions for most interventions” (Gilmore and McAuliffe, 2013)
  - especially for SSA (“…there is still little evidence from Africa on the effectiveness of CHWs…large-scale rigorous studies, including RCTs, are now urgently needed.” (Christopher et al, 2011)

- WHO survey (2010) confirms lack of incentives and sustainability is one of the main challenges
Introduction

CHWs

- Systematic reviews suggest overall positive health impact...

- ...but still (surprisingly) scarce rigorous evidence
  - especially from RCTs (PubMed search)
  - “...admittedly limited in quality and quantity” (Haines et al, 2007), “insufficient evidence is available to draw conclusions for most interventions” (Gilmore and McAuliffe, 2013)
  - especially for SSA (“...there is still little evidence from Africa on the effectiveness of CHWs...large-scale rigorous studies, including RCTs, are now urgently needed.” (Christopher et al, 2011)

- WHO survey (2010) confirms lack of incentives and sustainability is one of the main challenges

**In this study:**
We evaluate (through a RCT) an innovative entrepreneurial model of community health delivery in Uganda
Roadmap

1. The CHW program
2. Study Design
3. Results
4. Conclusion
The CHW program

**New program** implemented by two NGOs (Living Goods and BRAC):

- women, 18 to 45 years, community members
- 2 weeks initial training (key health and business)
- monthly refreshment trainings
- task: provide a mix of preventive, promotive, and basic curative services
- mixed product line: [NEW COMPONENT]
  - prevention goods (mosquito nets, water purification tablets, vitamins...)
  - treatments (ORS, zinc, antimalarial drugs...)
  - consumer goods (pampers, soap, toothpaste...)
- goods bought at wholesale price from local branches and sold with a markup (10-15% on average)
- additional incentives (∼0.7$) for visiting and assisting pregnant women
The CHW program

A local door-to-door sales-force, stocked with expertise and a basket of health and consumer goods to:

- Diagnose and treat under-5 children
- Make prompt referrals to clinics
- Provide counselling to pregnant women
- Sell affordable health and consumer products
- Make a small but steady income

Empirical Model

\[ Y(i, h, c, b) = \beta \text{Treatment}_c + \mu_b + \epsilon(i, h, c, b) \]

→ \( Y \): outcome of interest
→ \( Treatment \): treatment dummy
→ \( \mu \): branch fixed effect
→ \( \epsilon \): error term

Sample:

- 12 branches \( b \)
- 214 clusters \( c \)
- 7,018 households \( h \)
- 11,563 children under 5 \( i \)
### Results

   3.1 Main Outcomes
   3.2 Channels
   3.3 Cost-Effectiveness

4. Conclusion
Results
Cost-Effectiveness (PRELIMINARY)

- Estimated cost per averted death: $4,237
- Estimated cost per life-year gained: $71
Results
Cost-Effectiveness (PRELIMINARY)

- Estimated cost per averted death: $4,237
- Estimated cost per life-year gained: $71

- The (few) existing estimates from other CHW programs range from $82 (Kenya) to $3,396 (Indonesia) per life-year gained (Borghi et al, 2005; McPake et al, 2015)

- A child under-5 is estimated to contributes $65k in economic activity over his/her lifetime in SSA (Dahn et al, 2015)
  \[ \Rightarrow \text{returns} > 15:1 \]

- 35% of estimated cost per life saved that could be achieved by expanding a range of health services known to be effective (Perry and Zulliger, 2012)
Roadmap

1. The CHW program
2. Study Design
3. Results
4. Conclusion
Conclusion

First evidence of the effectiveness of an entrepreneurial CHW program

→ highly effective: large and significant health effects

→ different channels at work

→ (preliminary) cost effectiveness figures compares favorably to existing estimates from other programs

**Policy impact:** program is currently being scaled up to reach 5,500 villages and 4.4 million people by 2018 (⇒ second evaluation is ongoing)
Thank you!

Notes: Cells report mean (SD) across clusters included in the treatment or control group. A variety of sources were consulted to generate the original dataset, including documents and maps from national utilities, regional power pools, and the World Bank. Information on households and households with under-5 children per cluster was collected from the enumeration of trial villages at baseline. Data for medium and high voltage electricity transmission lines was obtained from the Africa electricity transmission network (AICD) study. Health Centers takes into account facilities from HCIII (i.e. parish-level health centers, roughly one per 5,000 people) and above. Hospitals refer only to district/national hospitals (roughly one per 500,000 people). Distance measures are all expressed in kilometers.
