1. Introduction

Kiranti languages typically have agreement with two arguments of transitive verbs, but it is also generally possible to suspend agreement with the object argument (which is in these languages a primary object in the sense of Dryer (1986, 2006), i.e. a grammatical relation aligning the sole object of monotransitives with the most goal-like argument of ditransitives). Sentences with object agreement and those without differ from each other not only in their semantics but also in many syntactic properties: it seems that in most Kiranti languages we are dealing here with two distinct syntactic structures and not simply with a case of optional agreement, i.e. a pattern where the presence of absence of agreement is found within exactly the same syntactic environment (with the same principles of case assignment and argument licensing) and responds exclusively to semantic and pragmatic parameters of discourse. However, there have so far been only very few detailed analyses of the relevant structures. Taking a closer look at Limbu and Belhare data (both Eastern Kiranti), respectively, Angdembe (1998) and Bickel (2003, 2004, 2006) find that constructions with suspended object agreement show typological similarities to both what is described as antipassivization in some languages and what is called object incorporation in other languages.

In this paper we analyze the syntax and semantics of suspended object agreement in Puma, a Southern Kiranti language.\textsuperscript{1} The Puma data are particularly revealing because the language has two versions of suspended object agreement, one following the general Kiranti model, and one involving a dedicated prefix kha- which we gloss as an antipassive marker. We show that the two kinds of suspended object agreement in Puma share some crucial properties but that the one marked by kha- is typologically closer to antipassivization in other languages while the other (un-marked) shares more properties with incorporation and optional agreement.

After explaining the basic morphological set-up of the two constructions in Section 2, we first describe the syntax of the two constructions (Section 3) and then focus on the semantics and the usage of the construction in discourse (Section 4). In Section 5 we summarize our findings and compare the Puma constructions to what is known in other languages as incorporation, antipassivization and optional agreement.

\textsuperscript{1} ISO 639-3: pum. The data discussed here was collected with support from the Volkswagen Foundation, DOBES Program, Grant No. II/79 092 (2004-2009), which is gratefully acknowledged (see Gaenszle et al. 2005 for a first report on the project, and http://www.uni-leipzig.de/-ff/cpdp for further information on the project). For helpful comments of an earlier draft, we thank Martin Haspelmath and two anonymous reviewers. Interlinear glossing follows the Leipzig glossing Rules (http://www.eva.mpi.de/lingua/files/morpheme.html), with the addition of ADD ‘additive focus’ and REP ‘reportative’. Examples that are not provided with a text reference are elicited. All examples, whether from texts or elicitation, were double-checked by two of us (Prem Dhoj Rai, Shree Kumar Rai), who are native speakers. The texts and paradigms analyzed in this paper are deposited at the DOBES archive (http://www.mpi.nl/DOBES).
Section 6 draws general conclusions from these findings for the typology of
detransitivization.

2. Morphology

Puma verbs regularly agree with the sole argument of intransitives (S), the most
agent-like argument of transitives (A) and the primary object (P) of transitives. Tables
1-3 contain sample past and nonpast indicative paradigms of simplex verbs (i.e. verbs
with a single, non-bipartite, monomorphemic stem without any stem alternation
beyond coronal augment that appear only before vowels). Table 1 shows an
intransitive verb (phind- ‘jump’), while Tables 2 and 3 illustrate a transitive verb
(cind- ‘teach’), both with an augment –d that surfaces only in prevocalic position.

---

2 Puma distinguishes several stem classes, and we limit illustrations here to the simplest class. The
analysis of stem classes and of complex (bipartite and compound) stems is beyond the scope of the
current paper. In any event, there is no evidence that stem morphology interacts with the syntactic
and semantic properties of suspended object agreement.

Table 3: Past affirmative and negative indicative paradigm of *cind-* ‘teach’
Himalayan Linguistics 7

Past and nonpast forms are neutralized in many cases, because the past tense suffix –a regularly deletes before vowels (e.g. cind-a-i > cind-i = cind-i ‘s/he teaches/taught him/her’). Older speakers tend to maintain a distinction in careful pronunciation (but not in fast speech) between past tense forms with long and/or low-tone vowels, such as [cindəŋ] ‘I taught him/her’ vs. [cindonŋ] ‘I teach her/him’, or [cindi:] ‘S/he taught him/her’ and short-vowelled nonpast forms like [cindi] ‘s/he teaches him/her’, derived from assimilation of –a to the subsequent vowel, followed by merger with that vowel (i.e. *cind-a-uŋ > cinduŋ > cinduŋ, *cind-a-i > cindi > cindi:). (Length and tone play no role in the phonology of Puma elsewhere.) In this paper we follow the speech of the younger generation, which also represent the majority of our informants. Thus, when we translate neutralized forms as past, nonpast would often be equally appropriate, and vice-versa.

Table 4 summarizes a preliminary morpheme analysis, drawing in part on Stutz (2005). Position classes (numbered) are based exclusively on formal co-occurrence and sequencing constraints.

Table 4. Affix analysis of simplicia (indicative mood only)

The last columns in the transitive paradigms in Tables 2 and 3 contain the forms with suspended object agreement (identified as such by ‘o’ in the object agreement header). These forms are identical to intransitive inflection, except for the presence of the prefix

5
kha-. The prefix kha- can also be dropped, but only if there is an overt object NP in the clause (most typically, with inanimate semantics). This is shown by the following example, with the verb lamma ‘to search, look for’.

(1) a. samen / doromen lam-u-η.
   someone something search-3sP-1sA
   ‘I looked for someone/something.’ (e.g. to help me work on this)

b. kha-lam-øŋ.
   ANTIP-search-1s.S.PST
   ‘I looked for someone/people.’

c. doromen lam-øŋ.
   something search-1s.S.PST
   ‘I looked for something/stuff.’

Example (1a) is an active transitive form, (1b) is a form with suspended object agreement and the prefix kha- (equivalent to the forms in last column of Table 3). The form in (1c) is the same but lacks the prefix; instead of the prefix, there is an object NP doromen ‘something’. In either case, the forms with suspended object agreement are identical with regular intransitive forms, as becomes evident when comparing the last column of Tables 2 and 3 with the forms in Table 1.

In the following we discuss the syntactic and semantic properties of the two forms illustrated by (1b) and (1c). We refer to suspended object agreement with a kha-prefix as the ‘kha-detransitive’ and to suspended object agreement without this prefix as the ‘ø-detransitive’.

3. Syntax

With transitively inflected verb forms, the A argument is obligatorily assigned ergative case in Puma. The P argument is assigned dative case. Dative case (-lai\(^3\)) is obligatory for the most goal-like argument of ditransitives, but it is banned from the least goal-like argument of ditransitives (typically, themes); with monotransitives, dative case is optional, but the odds for case marking are higher for human than non-human, animate than inanimate, and definite than indefinite arguments — thus following a pattern roughly similar to well-known instances of differential object marking from South Asia to Turkish and Spanish.

(2) a. ya-a yoŋi(-lai) tup-u-η.
     1s-ERG friend(-DAT) meet- 3sP-1sA
     ‘I met a/the/my friend.’

\(^3\) It is possible that the dative case marker is borrowed from Nepali -lāi, which has the same form and function.
Himalayan Linguistics 7

b. \( \eta a \) \( yomi-lai \) chetkuma(*-lai) itd-u-\( \eta \).
   1s-ERG friend-DAT clan.sister(*-DAT) give-3sP-1sA
   ‘I gave a/my sister to a/my friend (in marriage).’

While case assignment is differential, the agreement morphology of transitively inflected verb forms always follows a primary object pattern, aligning the sole object of montransitives always with the most goal-like argument of ditransitives.

With detransitive forms, case assignment and agreement follow the syntax of intransitive clauses: agreement is exclusively with the A argument, and the A argument is obligatorily assigned the (zero-marked) nominative case. The behavior of the P argument is different for \( \eta \)-detransitives and \( kha \)-detransitives. We discuss the two structures in turn.

3.1 The \( \eta \)-detransitive

While dative-marking of objects is optional in transitive clauses, as shown by (3a), with \( \eta \)-detransitive forms, the P argument obligatorily appears in the (zero-marked) nominative case; the dative is ungrammatical here, as shown by (3b):

(3) a. \( \text{khim(-lai) copp-u-\( \eta \).} \)
   house-DAT look.NPST-3sP-1sA
   ‘I look at the/a house.’

b. \( \text{khim(*-lai) cop-\( \eta \).} \)
   house (-DAT)look-1sS.NPST
   ‘I see houses.’ or ‘I do house-seeing.’ (in general, does not entail the existence of a specific house that the speaker has in mind)

The object is obligatory in \( \eta \)-detransitives: as shown by the following example, the object cannot be dropped under any pragmatic condition. This is in contrast with regular transitive clauses, where all arguments are syntactically optional.

(4) a. \( \eta \) \text{redjio en-\( \eta \).} \)
   1s radio hear-1sS.NPST
   ‘I do radio-hearing.’ (in general, does not entail the existence of a specific radio that the speaker has in mind)

b. \( *\eta \) \text{en-\( \eta \).} \)
   1s hear-1sS.NPST
   Intended: ‘I hear something.’

The absence of a nonzero case affix, obligatory appearance, and the translation might suggest that the object is incorporated in these examples. However, unlike in what one would expect under incorporation, the object need not be adjacent to the verb:
(5) a. ṇa khim cop-ṇa.
    1s  house  look-1s.NPST

b.  khim  ṇa cop-ṇa.
    house  1s  look-1s.NPST

Both: ‘I looked at houses.’

Both versions here are equally grammatical, and there is only a slight difference in information structure, so that in (5b) khim ‘house’ is more topical than in (5a).

If the pragmatics allow it, it is possible to relativize on the detransitivized object argument. Again, this would be unexpected under classical incorporation (although see Hermelink 1992 for a very unusual case of relativization on incorporated arguments). Example (6a) shows relativization on a detransitivized object; for comparison, (6b) and (6c) illustrate relativization on a transitive object and on the A argument of a detransitivized clause, respectively:

(6) a.  [[uŋ-yoŋni  khip=ku]  kitap]  [novel].
    1sPOSS-friend  [3sS-]<read=NMLZ  book  novel

    ‘The kind of book my friend reads is novels.’

b.  [[uŋ-yoŋni-a  khipd-i=ku]  kitap]  [novel].
    1sPOSS-friend-ERG  [3sA-]<read-3p=NMLZ  book  novel

    ‘The (specific) book my friend reads is a novel.’

c.  [[novel  khip=ku]  uŋ-yoŋni]  [təkku].
    novel  [3sS-]<read=NMLZ  1sPOSS-friend  DEM

    ‘This is my friend who reads novels.’

Suspended agreement cuts semantic entailments to an individuated, enumerable object referent (cf. Section 4 below), and so the translation of a relative construction in (6a) needs to include a ‘kind of’ notion, with generic reference. Example (6b) is the corresponding active transitive construction, where the relativized NP has entails an individual existing referent. The data in (6c) show that under detransitivization, the agent (now realized as an S argument) is still also a possible target of relativization. Since the referential status of this argument does not differ from the one in transitive clauses, no ‘kind of’ relation is entailed.

In line with its positional freedom, the object argument retains full-fledged NP status: unlike what is known from Limbu (Angdembe 1998: 20) and Belhare (Bickel 2006: 166ff) detransitivization, the object argument can be freely expanded by adjectival modifiers, as attested by the following example:

(7) ṇa kəheppəŋ khim cop-ṇa.
    1s  big  house  look-1s.NPST

    ‘I look at big houses.’

With ditransitive verbs, only direct objects (i.e. the least goal-like object argument) can be detransitivized:
(8) a. gai-lai ghasa itd-u-ŋ.
cow-DAT grass give-3sP-1sA
‘I gave the cow grass.’
b. gai-lai ghasa itd-oŋ.
cow-DAT grass give-1sS.PST
‘I gave grass to the cow.’
c. *ghasagai itd-oŋ.
grass cow give-1sS.PST

**Intended:** ‘I gave cows grass.’

(8a) represents a standard ditransitive structure. In (8b), the theme argument ghasa ‘grass’ is o-detransitive: it is obligatory and has non-specific reference. (8c) is ungrammatical because it is not possible to o-detransitize the primary object (the most goal-like argument) gai ‘cow’. Thus, the relevant grammatical relation for the purpose of detransitivization aligns monotransitive objects with ditransitive themes (direct-object alignment). This is in contrast to agreement in non-detransitive clauses, which is governed by a grammatical relation aligning monotransitive objects with ditransitive goals (primary-object alignment). (Case marking follows either a primary or a direct object pattern, depending on the referential status of the monotransitive object; cf. above.)

3.2 The kha-detransitive
Whereas the o-detransitive requires an overt object NP, the kha-detransitive bans overt objects. At the same time, the kha-form requires that the object referent be human. Thus, the only possible kha-detransitive of (9a) is one without any overt object NP but with human object semantics, as shown in (9b):

(9) a. ŋa-a kho-lai enn-u-ŋ.
1s-ERG 3s-DAT hear.NPST-3sP-1sA
‘I hear him/her.’
b. ŋa (*kho(lai) / *tokku(lai) / *mənn(lai) / *baja(lai)) kha-en-ŋa.
1s 3s(DAT) DEM(DAT) person(DAT) song(DAT) ANTIP-hear-1sS.NPST
‘I hear someone/people.’, not: * ‘I hear something.’

Since the kha-detransitive is specialized for human semantics, the o-detransitive is most commonly used ‘elsewhere’, i.e. with non-human semantics (as per Pāṇini’s Law). But this does not mean that the o-detransitive is incompatible with human objects. If the speaker wishes to be more specific about the nature of the human objects referenced by a detransitive form, a o-detransitive will be used:

(10) thorong-cha tat-oŋ.
male-offspring bring-1sS.PST
‘I brought some young man/men.’ (e.g. to help me work on this)

Accordingly, *khataton* ‘I brought someone/people’ is essentially equivalent to *mamma tatoyn* (with the generic noun *mamma* ‘human being, person’), but *khataton* is preferred by speakers, and we have the impression that it would be far more common in discourse (pending statistical analysis).

The opposite constraint on overt object NPs found in the two forms of detransitives is paralleled by other opposite properties. First, while *ə*-detransitives allow relativization on the detransitivized object argument (cf. the data in (6) above), this is impossible with *kha*-detransitives:

(11) a. *[[uy-qa hə-ku] mamma] [takku].
    1sPOSS-eB    ANtip-[3sS-]beat=NMLZ    person DEM
    Intended: ‘These are the kind of people that my brother beats up.’

b. *[[uy-qa] hə[-h=1=ku] mamma] [takku].
    1sPOSS-eB-ERG    [3sA-]beat=[3sP]=NMLZ    person DEM
    ‘This is the person that my brother beats up.’

c. *[[kha-yə-h=1] uy-la] [takku].
    ANtip-[3sS-]beat=NMLZ    1sPOSS-eB    DEM
    ‘This is my brother who beats up people.’

The only possibility to relativize on the object is with an active transitive construction, as in (11b). (11c) illustrates relativization on the agent of a detransitive clause, for comparison.

Second, we noted above that *ə*-detransitives can only be applied to theme arguments of ditransitives (cf. the data in (8) above). *Kha*-detransitives, by contrast, can only be applied to goal arguments of ditransitives, thus following a primary-object (rather than direct-object) pattern:

    friend-DAT    clan.sister    give-3sP-1sA
    ‘I gave my sister to a friend (in marriage).’

b. *chetkuma kha-itd-ə.
    clan.sister    ANTip-give-1s.PST
    ‘I gave away my sister to someone/people.’

    friend-DAT    ANTip-give-1s.PST
    Intended: ‘I gave someone/people/some sister to a friend.’

The sentence in (12a) has a regular ditransitive syntax. (12b) is a *kha*-detransitive derived from it. Here, the theme argument is retained while the goal NP is deleted, and the sentence entails a non-enumerable or generic goal (‘to someone, to people’). (12c) is
ungrammatical because the detransitivized and therefore deleted argument would have to be the theme rather than the overt goal argument.  

4. Semantics

With regard to the semantics, we find no evidence that the two detransitive structures differ beyond the fact that (i) the kha-antipassive is limited to human arguments, and (ii) the ə-detransitive but not the kha-detransitive allows lexical specification of the detransitivized object. Both structures share the semantic property of deleting any entailment to the cardinality of referents and are thus generally used for non-enumerable or generic referent, as we explain in the following.

In standard intransitive or transitive clauses, Puma agreement desinences are neutral as to the referential status of the arguments they are triggered by. Specifically, agreement markers can be coindexed with specific-reference NPs just as well as with indefinite pronouns and generic expressions.  

This is true of all agreement markers alike. We first discuss this with data for A-agreement, then for P-agreement.

Consider the following data, where the verb form is transitive and shows third person singular A agreement (which is zero-marked, cf. Tables 2 and 3):

(13)a. khokk-ə khaŋ-i.  
3s-ERG [3sA]-see-3sP  
‘S/he saw it.’

b. samen-ə khaŋ-i (koina ka-khaŋ pə-sin-nəŋ).  
someone-ERG [3sA]-see-3sP [PST] but ACT.PTCP-seeNEG-know-1sNEG  
‘Someone saw it (but I don’t know the one who saw it).’

c. sa(men)-a=cha pə-khaŋ-i-n.  
anyone-ERG=ADD NEG-[3sA]-see-3sP-NEG  
‘Nobody saw it.’

d. ak-poŋ-a pə-khaŋ-i-n.  
one-HUM.CLF-ERG NEG-[3sA]-see-3sP-NEG  
‘Someone did not see it.’

e. ənapoŋ-a jhara=ku sind-i.  
shaman-ERG all=EMPH [3sA]-know-3sP [PST]  
‘The (known) shaman knows everything’ or: ‘A shaman knows everything.’

The A expression in (13a) is a personal pronoun with specific reference, while in (13b) and (13c), it is an indefinite pronoun. Singular number agreement in the verb and absence of a nonsingular suffix on the pronoun entail that there is exactly one A referent in all three examples. In (13a) the identity of this referent is presupposed. In (13b), by contrast,  

4The sentence would be grammatical if ə gündi ‘friend’ (without dative case) would be analyzed as the theme argument, resulting in the pragmatically odd reading ‘I gave a friend to someone/people’.

5The pronominal system of Puma is described in Sharma (Gautam) et al. (2005).
the referent’s identity may or may not be known (or deemed relevant) to the speaker, i.e. the sentence could be felicitably continued by koina kakhay pasimnay ‘but I don’t know who saw it’ (unlike (13a), which could not be continued in this way). Negation, as in (13c), has scope over the indefinite negative polarity pronoun sa(men)=cha. As a result, the sentence denies the existence of any A referent. This is in minimal opposition to (13d), where the numeral akpoŋa ‘one’ is outside the scope of negation so that the sentence asserts the existence of a specific referent identifiable for the speaker. In (13e), the A referent can either be understood as an individual referent or as a generic expression referring to any specific shaman, but to the kind of people who are shamans.

The following set of data illustrates P-agreement under various referential conditions. In all forms, P-agreement is third person singular, which has zero exponence in several negative forms (cf. the paradigms in Tables 2 and 3).

(14a) khokku-lai lam-u-ŋ. 3s-DAT search-3sP-1sA
   ‘I looked for him/her.’

b. samen lam-u-ŋ (koina pa-dhit-nag). someone search-3sP-1sA but NEG-find-1sNEG
   ‘I looked for someone (but didn’t find anyone).’

c. sa(men)=cha pa-lam-nag. anyone=ADD NEG-search-1sNEG
   ‘I didn’t look for anyone.’

d. ak-poŋ pa-lam-nag (baŋhe ka-poŋ). one-HUM.CLF NEG-search-1sNEG many DET-HUM.CLF
   ‘I did not search for one person (but for several).’

e. neta-lai tupd-u-ŋ. leader-DAT know-3sP-1sA [NPST]
   ‘I understand the leader’ or: ‘I understand the nature of leaders.’

In (14a) the P-agreement trigger is a third person singular object pronoun with specific reference. In (14b), the trigger is an indefinite pronoun. The sentence is appropriate, for example, when the speaker was looking for someone to help him on a certain task (or for someone to hire for a certain job). Thus, the indefinite pronoun can have non-specific reference, and a result, the sentence can be felicitably continued by koina padhitnay ‘but I didn’t find anyone’, in parallel to what we observed for indefinite pronouns in A-function in (13) above. Also in parallel with this, negation has scope over the negative polarity indefinite pronoun sa(men)=cha in (14c). In (14d), the numeral akpoŋ ‘one’ is outside the scope of negation, and thus entails the existence of an (albeit non-specific) referent. (14e) illustrates the use of a generic expression as the object NP triggering P-agreement: neta ‘leader, politician’ is in the singular (as shown by the absence of a nonsingular affix and by triggering singular P-agreement on the verb) and can either be
understood as referring to an individual or to the kind denoted by the expression (the characteristics associated with neta).

Thus, active agreement morphology is neutral as to the referential status of the agreement-triggering A or P expression. The only entailment that is necessarily made in all contexts is to number: all examples in (13) and (14) entail that, if there is a referent, there is at most one or, in case of generics, at most one kind. (With dual and plural agreement, the respective entailment is to at most two and to more than two possible referents.) The number specification entailed by P-agreement in active morphology is precisely what distinguishes these forms from ditransitive forms: a ditransitive form signals that the cardinality of the set of object referents is unknown. Accordingly, a ditransitive clause is true if the set is empty just as well as if it is filled by any non-specified number of referents.

Thus, a sentence like (14b) forms a minimal pair with the following kha-ditransitive:

(15)  
\begin{align*}
\text{kha-lam-ọ} & \quad (\text{koina kha-pa-dhit-nya}). \\
\text{ANTIP-search-1s.PST} & \quad \text{but} \quad \text{ANTIP-NEG-find-1sNEG [PST]} \\
\text{‘I looked for someone/people (but didn’t find any(one)).’}
\end{align*}

While (14b) entails that I looked for at most one person, (15) is neutral as to whether I looked for one or several persons. By blocking an entailment to a specific cardinality of referents, the ditransitive form leaves it open whether there exists a referent satisfying the argument position defined by the predicate (here, a referent that was being looked for) and if there is one, how many referents would satisfy this position. The active form with an indefinite pronoun in (14b) can be used in the same way, as we noted above, but it is also suitable in a context where the speaker does have a specific existing referent in mind.

The following minimal pair shows the same contrast for nonhuman objects and the ọ-ditransitive:

(16)a. doromen lam-u-ọ (koina pa-dhit-nya).
\begin{align*}
\text{something} & \quad \text{search-3sP-1sA} & \quad \text{but} & \quad \text{NEG-find-1sNEG} \\
\text{‘I looked for something (but didn’t find anything).’ (e.g. anything that would help me do what I need to do)}
\end{align*}

b. doromen lam-ọ (koina pa-dhit-nya).
\begin{align*}
\text{something} & \quad \text{search-1sP.PST} & \quad \text{but} & \quad \text{NEG-find-1sNEG} \\
\text{‘I looked for something/stuff (but didn’t find anything).’ (e.g. anything that would help me do what I need to do)}
\end{align*}

The sentence in (16a) has active transitive morphology, the one (16b) represents a ọ-ditransitive. The active form entails that, if there is an object referent, there is at most one, but the sentence is semantically neutral as to whether there is a specific referent that the speaker has in mind or not. As with the kha-ditransitive, the ọ-ditransitive blocks the entailment to any number specification, and as a consequence also to any specific referent. As a result, (16b) can only be used if the speaker wishes to leave open both number and existence of the object referent.
These semantic effects find ample illustration in language use. The first example shows how a kha-dettransitive is used to leave open the number and existence of object referents:

(17) ṭuŋ-bo ṭuŋ-palo oha (gesturing) kha-cop-oŋ. beŋ patti źkta
1s-GEN 1sPOSS-turn like.this ANTIP-look-1s.PST left side one
makcacak=ćak=ku bura khok-pa yuŋ-a-ŋa. (LH.M.363)
black-REDUPL=NMLZ old.man old-M [3sS]-be-POST-IPFV

‘And then I, on my turn, looked (ANTIP) at the people like this (gesturing), and, on the left side, there was an old black man.’

In this example, the existence of object referents, a group of people at a recruitment place, is known from the previous discourse. What the kha-dettransitive (antipassive) form suggests, is that the speaker did not look at any specific number or at any specific individual in this group — he simply scanned the group with no particular focus, until he zooms in on źkta makcacak=ćak=ku bura khokpa ‘one old black man’.

While in (17) we know from the context that there are object referents, the dettransitive form is also commonly used in contexts where the existence of such referents is not guaranteed (as we saw already in the elicited example (15) above), or whether this is precisely at stake in the current conversation or narrative. This is the case in the following example:

(18) paaŋ akhari ohyatni kha-cop-a=ni. ka-nana-ci Toŋwama
and.then hither thither ANTIP-look-PST-REP 3sPOSS-eS ns T.
Kh.-ms-ACROSS-ALL ANTIP-[3sS]-look-PST=REP anyone=ADD
NEG.EXIST.PST-d-REP
topr=na khap=ma puss-i=ni. khap-a-ŋa khap-a-ŋa
then.after=TOP weep-INF begin-3sP[PST]=REP [3sS]-weep-PST-IPFV [3sS]-weep-PST-IPFV
kha=ño=ni, ka-ţaŋkoŋ-di-tmi kha-cop-a. ńk-ta ńkasi,
when=REP 3sPOSS-pillow-UP-ALL ANTIP-[3sS]-look-PST one-CLF banana
ńk-ta berucha, ńk-ta bechukyũŋya=ni (folk_tale.056ff.DR)
one-CLF small.sick one-CLF ginger PST.EXIST=REP

‘Then he looked (ANTIP) hither and thither (for them). He looked (ANTIP) in the direction of his sisters Toŋwama and Khiwama’s place, (but) there wasn’t any one of them! Then he started to cry. As he was crying and crying, he looked (ANTIP) up towards the pillow (having them in mind): there was one banana, one small sickle, and ginger (which the two had left for him).’

The kha-dettransitives here are based on the verb cop- ‘look at, watch (intentionally)’ and entail that the number and existence of the object referent are unknown; all that is known is the direction of the looking, as indicated by the allative NPs akhari ohyatni ‘hither and thither’, Toŋwama Khiwamaciyaní ‘towards Toŋwama and Khiwama’s place’, and
Himalayan Linguistics 7

kτανκονditni ‘towards his pillow’. Therefore it is perfectly natural to continue khacopa
‘he looked for them’ by sachi metd¢¢¢¢π¢ π¢ ‘there wasn’t any one of the two’ in line 2.6
Note that an appropriate translation of khacopa into English has to resort here to ‘he
looked for them’ (which in Puma would actually be lamaci, as found in (14) above),
because in English he looked at people or he watched the people necessarily entails
the existence of object referents and could not be felicitously continued by ‘there wasn’t
anyone’.

The following example contains the verb lam- ‘to search’, and in line with its
semantics, the directional specification is less specific than with cop- before:

(19) tapagari Hetchakuwa jhara khim hut-do-tni kha-lam-a=ni
then H. all house inside-LOC-ALL ANTIP-[3S]-search-PST=REP

tana mudhi wadin bechuk masit dhit-i=ni. (folk_tale.170f)
PTCL ashes chicken.egg ginger black.lentil find-3SP=REP

‘Then Hetchakuwa searched inside the whole house (for people) (but instead)
he found ashes, chicken eggs, ginger and black lentils.

Here, the kha-detrasitive khalama entails that the subject looked for human beings — of
any number — all over the house; from the narrative context it becomes clear that he
does this in order to make sure that no one will see him when he escapes from the place
he is kept.

While in the preceding examples, the existence of the object referent is uncertain,
under negation the existence of any number of referents is denied:

(20) tonpham ak chem kha-p¢-tok-en=ni. (folk_tale.186)
then one moment ANTIP-NEG-[3S]-be.able.to.see-NEG.PST=REP

‘Then, for a moment, she could not see anyone.’

(21) akwada kaphewa=cha kha-p¢-it-nin=ku min-

o¢. (LH_M.124)
ever money=ADD ANTIP-NEG-[3S]-give-NMLZ think-1s.S.PST

‘I thought he would never give money to anyone.’

In (20), the kha-detrasitive presupposes the non-existence of a monotransitive human
object, while in (21) it refers to the primary object of a ditransitive verb, confirming the
observation on object alignment made in Section 3.2 above.

Since detransitive forms entail unknown cardinality and existence of the object
argument, they are also compatible with generic reference. Like the object argument of
detransitives, generic expressions are characterized by non-specified cardinality, but in
addition, they entail that the generic concept could in principle be instantiated by an
exemplar (within a given universe of discourse). Thus, the following sentence, for

6 The partitional ‘any one of the two’ readings results from combining the singular subject expression
sacha ‘anyone’ with the dual subject agreement form -ci on the verb, following a general principle of
Tibeto-Burman agreement syntax (see Bickel 2000).
example, entails that that subject married, i.e. there must be a *khimhojma* ‘wife’, but no specific referent is presupposed or mentioned in the context:

(22) *khimhojma* tat-\(a\)=ni (folk_tale.247)

\[
\begin{array}{ll}
\text{wife} & [3sS]\text{-}\text{bring-PST}=\text{REP} \\
\end{array}
\]

‘He married.’

The following examples of *kha*-detransitives imply that the object argument is a generic human being. Within the given universe of discourse (here, mythology), the generic concepts could in principle be instantiated, but no such instantiation is sought for by the speaker and it is indeed not relevant for the development of the discourse:

(23) *ronabhetma* *kha-ka-ca-ma* (myth_orph.127b)

\[
\begin{array}{ll}
\text{evil}\text{.woman} & \text{ANTIP}\text{-}\text{ACT}\text{-}\text{PTCP-eat-F} \\
\end{array}
\]

‘an evil female man-eater (ANTIP)’

(24) *cabha*, *masa*, *yanwa*, *bhaisuma*, *dhiwama*,

\[
\begin{array}{ll}
\text{hwaku}, & \\
\text{tiger}\text{, bear}\text{, bee}\text{, big.red.bee}\text{, hornet} & [3sS]\text{-}\text{walk-PST}=\text{NMLZ} \\
\end{array}
\]

\[
\begin{array}{ll}
kha-kep=ku, & kha-kha=ku, \\
\text{ANTIP-}[3sS]\text{-}\text{sting}=\text{NMLZ} & \text{ANTIP-}[3sS]\text{-}\text{bite}=\text{NMLZ} \quad \text{ANTIP-}[3sS]\text{-}\text{eat}=\text{NMLZ} \\
\end{array}
\]

‘Tiger, bear, bee, the kind [of animal] that stings (people), that bites (people), that eats (people).’

The participle marked by *ka-* in (23) refers to someone female (-*ma*) who eats human beings, i.e. a man-eater, and no specific referent is intended. Likewise, in (24), the nominalized *kha*-forms refer to animals that sting, bite or eat people in general.

5. Typological comparison

Table 5 summarizes the syntactic and semantic properties of the two constructions, as discussed in the previous sections. The properties that they share are suspension of object agreement, intransitive case assignment, and unknown cardinality. In all other regards, the two structures differ.

<table>

Table 5: Properties of the two detransitive constructions in Puma
Puma ø-detransitives share most properties with comparable structures known in other Kiranti languages, except that unlike in Limbu and Belhare, they allow expansion of object NPs by adjectival modification. The kha-detransitive has no parallel that we would know of in any Kiranti language. It is unique both in having a dedicated morphological marker and in banning the appearance of overt object NPs.

Outside the Kiranti family, ø-detransitives can be typologically compared to both what is known as incorporation and as optional-agreement patterns. With incorporation structures, they share the property of requiring an overt object and the property of nonspecific reference, but they differ from (at least the best known) incorporation structures in all other respects, specifically, in allowing objects to float away from the verb stem and in allowing relativization on the object argument. The fact that objects of ø-detransitives can move away form the verb stem is also in line with the fact that there is no evidence that the object would form a single grammatical (let alone phonological) word with the verb stem (e.g. no verbal prefix would ever be found preceding an object noun). Puma ø-detransitives are similar to optional-agreement patterns insofar as the object retains the syntactic properties of a full-fledged NP (with positional freedom and the possibility of adjectival modification) and insofar as it can be relativized on. Ø-detransitives differ from optional-agreement insofar as some crucial aspects of the syntax change: objects become obligatory, and they can no longer bear case. In addition, the A argument can no longer appear in the ergative.

Kha-detransitives are different from both incorporation and optional agreement structures since they ban overt objects. Kha-detransitives can be best compared to what is called antipassive in some languages. They share with antipassives in other languages is affixal marking and a strictly intransitive syntax in terms case assignment and relativization possibilities. They differ from antipassives in other languages in the fact that they obligatorily delete objects, and that the object must have non-specific reference; in many languages, the demoted object of an antipassive is allowed to surface in an oblique case.

Table 6 summarizes these findings by comparing the two Puma detransitives to the properties that are commonly associated with antipassives (‘ANTIP’), incorporation (‘INCORP’) and optional agreement patterns (‘OPT.AGR’). Note that that we use the term ‘commonly’ here in a very impressionistic sense, informed by how the notions in the table are typically used in the literature; it is not based on a quantitative typological survey of constructions with the properties listed across many languages.

Table 6: Typological comparison 7 (‘?’ = true in some languages)

6. Conclusions

All languages have constructions that are unique to them, and the goal of typological comparison is not so much to equate language-specific constructions as the same across languages (thereby reducing diversity) but to show, with some precision, in which regards constructions share properties and in which regards they do not share properties across languages (thereby measuring diversity). Notions like ‘antipassive’ (or ‘incorporation’, or whatever) are usually meant to imply a whole set of properties at the same time (e.g. the ones in Table 6 above), and when calling constructions in different languages all ‘antipassives’, we expect them to share this set of properties to a substantial degree (while perhaps still differing in other properties).

The Puma constructions analyzed in this paper do not share the whole set of properties one usually associates with either antipassivization, incorporation or optional agreement, but they are not totally different from any one of these either. As shown in Table 6, they share some specific properties, but not others. Without a large-scale typological survey, we do not know whether the Puma patterns are rare or even unique; it could also be the case that our expectations of what is common and our cross-linguistic notions thereof are premature, and that there is much more diversity in how specific syntactic and semantic properties combine in individual languages.

7 All properties in Table 6 are meant to be defined in terms of language-internal contrasts, e.g. ‘P is obligatory’ means that P is obligatory in the construction under review by contrast to other constructions in the same language, where P is not obligatory. When P is always obligatory, this is obviously not a property of the construction under review, but a more general property of the syntax of this language.
