Silica gel-catalyzed regio- and stereoselective reactions of thiocarbonyl compounds with optically active monosubstituted oxiranes

Fu, Changchun ; Linden, Anthony ; Heimgartner, Heinz

Abstract: The reactions of 1,1,3,3-tetramethylindane-2-thione (1) with (S)-2-methyloxirane ((S)-2) and (R)-2-phenyloxirane ((R)-6) in the presence of a Lewis acid such as $\text{BF}_3 \cdot \text{Et}_2\text{O}$, SnCl_4 , ZnCl_2 or SiO_2 in dry CH_2Cl_2 led to the 1,3-oxathiolanes ((S)-3) and ((R)-4) with Me at C(5) and C(4), and to (S)-7 with Ph at C(4), respectively (Schemes 2 and 3). The SiO_2 -catalyzed reaction of 4,4-dimethyl-2-phenyl-1,3-thiazole-5(4H)-thione (8) with (R)-6 gave two diastereoisomers ((5S,8S)-9) and ((5R,8S)-9) (Scheme 4). In the case of adamantane-2-thione (10) and (S)-2 or (R)-6 with ZnCl_2 or SiO_2 as catalysts, (S)-11 and (R)-12 with Me at C(5) and C(4), respectively, and (S)-13 with Ph at C(4), were formed. In addition, an unexpected isomer ((R)-14) with Ph at C(5) and 1,3-dioxolane ((S)-15) were isolated as minor products (Schemes 5 and 6). The structure of (S)-13 was confirmed by X-Ray crystallography (Figure 1). These results show that the SiO_2 -catalyzed addition of oxiranes to $\text{C}=\text{S}$ bonds proceeds with high regio- and stereoselectivity via an $\text{S}_\text{N}2$ -type mechanism.

(Dedicated to Professor A. I. Meyers on the occasion of his 70th birthday)

Abstract – The reactions of 1,1,3,3-tetramethylindane-2-thione (**1**) with (*S*)-2-methyloxirane ((*S*)-**2**) and (*R*)-2-phenyloxirane ((*R*)-**6**) in the presence of a *Lewis* acid such as BF₃·Et₂O, SnCl₄, ZnCl₂ or SiO₂ in dry CH₂Cl₂ led to the 1,3-oxathiolanes ((*S*)-**3**) and ((*R*)-**4**) with Me at C(5') and C(4'), and to (*S*)-**7** with Ph at C(4'), respectively (*Schemes 2 and 3*). The SiO₂-catalyzed reaction of 4,4-dimethyl-2-phenyl-1,3-thiazole-5(4*H*)-thione (**8**) with (*R*)-**6** gave two diastereoisomers ((5*S*,8*S*)-**9**) and ((5*R*,8*S*)-**9**) (*Scheme 4*). In the case of adamantane-2-thione (**10**) and (*S*)-**2** or (*R*)-**6** with ZnCl₂ or SiO₂ as catalysts, (*S*)-**11** and (*R*)-**12** with Me at C(5') and C(4'), respectively, and (*S*)-**13** with Ph at C(4'), were formed. In addition, an unexpected isomer ((*R*)-**14**) with Ph at C(5') and 1,3-dioxolane ((*S*)-**15**) were isolated as minor products (*Schemes 5 and 6*). The structure of (*S*)-**13** was confirmed by X-Ray crystallography (*Figure 1*). These results show that the SiO₂-catalyzed addition of oxiranes to C=S bonds proceeds with high regio- and stereoselectivity *via* an S_N2-type mechanism.

INTRODUCTION

The reactions of thiocarbonyl compounds with 2-mono- and 2,3-disubstituted oxiranes in the presence of a *Lewis* acid to form 1,3-oxathiolanes have been investigated recently.²⁻⁵ All of the

results described previously indicate an S_N2 -type mechanism, involving the ring-opening of the activated oxiranes by the nucleophilic attack of the thiocarbonyl S-atom, *i.e.*, in the case of 2,3-disubstituted oxiranes, an inversion of the configuration of one oxirane C-atom occurred.⁴ In the case of 2-monosubstituted oxiranes, the reactions proceeded with high regioselectivity⁵ so that the preferred attack took place at C(3) of alkyl-substituted oxiranes (O-C(3) cleavage), but at C(2) of phenyloxirane (O-C(2) cleavage) with inversion of configuration. Therefore, for the formation of 1,3-oxathiolanes *via* the *Lewis* acid catalyzed reactions of oxiranes with thioketones, the following mechanisms were proposed (*Scheme 1*).

Scheme 1

With the aim of getting more insight into the regioselectivity and the stereochemical course of the ring-opening of oxiranes in the formation of 1,3-oxathiolanes, the reactions of nonenolizable thiocarbonyl compounds with optically active oxiranes, *i.e.*, (*S*)-2-methyloxirane ((*S*)-**2**) and (*R*)-2-phenyloxirane ((*R*)-**6**) were carried out. For the first time, it was discovered that the reactions can be catalyzed by silica gel and take place with high regio- and stereoselectivity.

RESULTS AND DISCUSSION

Reactions of 1,1,3,3-tetramethylindane-2-thione (1**) with oxiranes.** – With (*S*)-2-methyloxirane ((*S*)-**2**). To a solution of **1** and 0.5 of equiv. of $\text{BF}_3 \cdot \text{Et}_2\text{O}$ in dry CH_2Cl_2 at -60°C under N_2 , 2 equiv. of (*S*)-**2** was added dropwise. The color of the mixture changed from orange to pale pink. After 25 min, the reaction was quenched by addition of H_2O . Chromatographic separation

gave two isomers ((*S*)-**3**) and ((*R*)-**4**), as well as **5** in 41, 2, and 9% yields, respectively. The starting material (**1**) was recovered in 46% yield (*Scheme 2, Table 1*). The reaction was repeated at room temperature for 2 days in the presence of silica gel, whereby only one isomer ((*S*)-**3**) and the ketone (**5**) were obtained in 2 and 3% yields, respectively. However, the starting material (**1**) was recovered in 85% yield (*Scheme 2, Table 1*).

Scheme 2

Table 1. BF_3 - and SiO_2 -Catalyzed Reaction of **1** with (*S*)-**2** in CH_2Cl_2

	Temp.	Reaction time	Yield [%] and specific rotation ($[\alpha]_D^{22}$) of products				
			(<i>S</i>)- 3	(<i>R</i>)- 4	5	1	
$\text{BF}_3 \cdot \text{Et}_2\text{O}$	-60°C	25 min	41 (+12.9°)	2 (+26.5°)	9	46	
SiO_2	rt	48 h	2 (+13.2°)	-	3	85	

The structures of (*S*)-**3** and (*R*)-**4** were assigned by means of ^1H - and ^{13}C -NMR spectra and by comparison with those described previously.⁵ The formation of (*S*)-**3** proceeded without change of configuration at C(5') as the nucleophilic attack of the thiocarbonyl S-atom took place at C(3) of (*S*)-**2**. On the other hand, the formation of (*R*)-**4** occurred with inversion of configuration at C(4') as a result of the nucleophilic attack of the thiocarbonyl S-atom at C(2) of (*S*)-**2** via an $\text{S}_{\text{N}}2$ -type process, which led to the opening of the oxirane ring, and then, subsequent cyclization gave the product. The results are in accordance with the mechanism postulated in *Scheme 1*.

With (*R*)-2-phenyloxirane ((*R*)-**6**). The reaction of **1** with (*R*)-**6** in the presence of $\text{BF}_3 \cdot \text{Et}_2\text{O}$, SnCl_4 , ZnCl_2 or silica gel at different temperatures gave only one isomer ((*S*)-**7**) in 8, 23, 6 and 3% yields, respectively. In the cases with SnCl_4 and ZnCl_2 , as well as with $\text{BF}_3 \cdot \text{Et}_2\text{O}$ after longer time, **5** was isolated as a by-product. The starting material (**1**) was recovered in a large amount (*Scheme 3, Table 2*).

Scheme 3

Table 2. Lewis Acids Catalyzed Reaction of **1** with (R)-6 in CH_2Cl_2

	Temp.	Reaction time	Yield [%] and specific rotation ($[\alpha]_D^{22}$) of products		
			(S)-7	5	1
$\text{BF}_3 \cdot \text{Et}_2\text{O}$	rt	7 min	8 (-13.8°)	-	79
	-78°C	3.5 h	24 (+31.3°) ^a	4	72
SnCl_4	-78°C	5 min	23 (-42.9°)	26	44
ZnCl_2	-30°C	9 h	6 (-33.4°)	8	82
SiO_2	rt	48 h	3 (-36.5°)	-	93

a) (S)-2-Phenyloxirane was used as reactant.

The structure of (S)-7 was assigned on the basis of ^1H - and ^{13}C -NMR spectra and by comparison with those described previously.⁵ The enantiomeric purity of (S)-7 was determined with the help of the shift reagent (R)-(-)-1-(9-anthryl)-2,2,2-trifluoroethanol, and the results showed that (S)-7 formed in the cases of SnCl_4 and silica gel was almost enantiomerically pure; however, the reactions with $\text{BF}_3 \cdot \text{Et}_2\text{O}$ or ZnCl_2 as a catalyst resulted in partial racemization depending largely on the temperatures at which the reactions were carried out. The determinations were in good agreement with the specific rotations shown in Table 2. It could be concluded that the higher the reaction temperature, or the stronger the Lewis acid was, the more racemization took place.

Reaction of 4,4-dimethyl-2-phenyl-1,3-thiazole-5(4H)-thione (8**) with (R)-6.** The reaction of **8** with (R)-6 in the presence of silica gel at room temperature for 64 h and 72 h led to two diastereoisomers ((5S,8S)-9) and ((5R,8S)-9) as colorless oils in a ratio of 20:1 and 6:1, respectively. In addition, the starting material (**8**) was partially recovered (Scheme 4).

The reaction of **8** with (*RS*)-**6** in the presence of $\text{BF}_3 \cdot \text{Et}_2\text{O}$ at room temperature for 3 days, giving (*5RS,8RS*)-**9** and (*5RS,8SR*)-**9** in a ratio of 1:1.3, has been reported previously.⁶ Therefore, with silica gel as the catalyst, the reaction proceeded with higher diastereoselectivity and, moreover, the sterically unfavorable (*5S,8S*)-**9** was the main product.

Scheme 4

The structures of (*5S,8S*)-**9** and (*5R,8S*)-**9** were assigned by means of ^1H - and ^{13}C -NMR, CI-MS spectra and by comparison with those described previously.⁶ The *Dreiding*-model examination of (*5S,8S*)-**9** shows that the spatial distances between the front Me-group and 2 H-atoms of the Ph-group at C(8) and 1 H-atom at C(7) are small, which corresponded well with the NOESY-spectrum (600 MHz, CDCl_3) of (*5S,8S*)-**9** that showed two relevant cross-signals between Me at 1.72 ppm and 2 H of Ph at 7.41-7.38 ppm as well as 1 H-C(7) at 4.55-4.53 ppm. The results were in accordance with the NOE-experiment described previously.⁶ Similarly, the *Dreiding*-model of the diastereoisomer ((*5R,8S*)-**9**) shows that the distance between the front Me-group and the H-atom at C(8) is small, in accordance with the NOESY-spectrum (500 MHz, CDCl_3) of (*5R,8S*)-**9** that showed a relevant cross-signal between the front Me at 1.65 ppm and H-C(8) at 4.70 ppm.

Epimerization of (*5S,8S*)-9** with HCl.** A solution of (*5S,8S*)-**9** in CH_2Cl_2 was treated with 3 drops of concentrated HCl at room temperature for 3 days. After usual workup, preparative TLC yielded 3% of (*5R,8S*)-**9**, and the starting material ((*5S,8S*)-**9**) was recovered in 25% yield.

Reactions of adamantane-2-thione (10**) with oxiranes.** – To a solution of **10** and 2 equiv. of (*S*)-**2** in dry CH_2Cl_2 , silica gel was added at room temperature under N_2 . After stirring the mixture for 12 h, the color of the suspension had changed very little. Chromatographic separation gave

two isomers ((*S*)-**11**) and ((*R*)-**12**) in 27 and 2% yields, respectively (ratio of 14:1). In addition, the starting material (**10**) was partly recovered (*Scheme 5*).

Scheme 5

The analogous ZnCl_2 -catalyzed reaction of **10** with (*R*)-**6** at -30°C (8.5 h), led to only one isomer ((*S*)-**13**) in 28% yield, whereas in the presence of silica gel at room temperature (48 h), two isomers ((*S*)-**13**) and ((*R*)-**14**) were obtained in 29 and 2% yields, respectively (ratio of 15:1), as well as the un-expected product ((*S*)-**15**) in 23% yield.⁷ After 10 h at room temperature, the SiO_2 -catalyzed reaction gave only the two isomers ((*S*)-**13**) and ((*R*)-**14**) in 54 and 5% yields, respectively (ratio of 11:1); no (*S*)-**15** could be detected. In this case, 6% of the starting material (**10**) was recovered (*Scheme 6*, *Table 3*).

Scheme 6

Table 3. ZnCl_2 - and SiO_2 -Catalyzed Reaction of **10** with (*R*)-**6** in CH_2Cl_2

	Temp.	Reaction time [h]	Yield [%] and specific rotation ($[\alpha]_D^{24}$) of products			
			(<i>S</i>)- 13	(<i>R</i>)- 14	(<i>S</i>)- 15	10
ZnCl_2	-30°C	8.5	28 (-66.5°)	-	-	-
SiO_2	rt	48	29 (-69.4°)	2	23 ($+4.9^\circ$)	-
	rt	10	54 (-72.5°)	5 (-133.7°)	-	6

On the basis of ^1H - and ^{13}C -NMR spectra, elemental analyses, CI-MS, and comparison with the analogues described previously,⁵ the structures of (*S*)-**11**, (*R*)-**12**, (*S*)-**13**, (*R*)-**14**, and (*S*)-**15** were assigned, and that of (*S*)-**13** was established by X-Ray crystallography (see *Figure 1*). The crystals are enantiomerically pure and the absolute configuration of the molecule has been confidently determined independently by the diffraction experiment. The compound has the expected 4'S configuration.

Figure 1. ORTEP Plot⁸ of the molecular structure of (*S*)-**13** (arbitrary numbering of the atoms; 50% probability ellipsoids)

In the presence of silica gel, the results of the reactions of **10** with (*S*)-**2** and (*R*)-**6** showed that Me and Ph substituents have significant influence upon the regioselectivity of the ring opening of the oxirane by the nucleophilic attack of the thiocarbonyl S-atom. The ratio of 5'-Me substituted product ((*S*)-**11**) to 4'-Me substituted product ((*R*)-**12**) amounted to 14:1, whereas that of the corresponding Ph substituted products ((*R*)-**14**) to ((*S*)-**13**) was almost inverse, *i.e.*, 1:15 and 1:11, respectively, according to the reaction time of 48 h and 10 h (*Table 3*).

EXPERIMENTAL

General remarks. See ref.⁹ IR spectra (film, cm^{-1}), NMR spectra at 300 (^1H) and 75.5 MHz (^{13}C) in CDCl_3 , if not otherwise stated. Optical rotations were recorded on Perkin-Elmer-241 polarimeter ($c = 1$, in THF).

General procedures for the reactions of thiocarbonyl compounds (1, 8, and 10) with oxiranes ((*S*)-2**) and ((*R*)-**6**).** – Procedure 1: To the solution of thioketone (**1**) or (**10**) (*ca.* 1

mmol) in dry CH₂Cl₂ (10-15 mL) under N₂ atmosphere, 0.5 equiv. of a *Lewis* acid (BF₃·Et₂O, SnCl₄ or ZnCl₂) was added at -78°C, -60°C, -30°C, and rt, respectively. In general, this led to a more or less pronounced change in the color of the solution. After stirring the mixture for 15 min at the selected temperature, *ca.* 2 equiv. of oxirane ((*S*)-**2**) or ((*R*)-**6**) was added dropwise, whereby the color of the solution changed rapidly in most cases. Then, the reaction was quenched by addition of H₂O and the mixture was washed with sat. aq. NaCl solution (3×). The combined organic layers were dried (MgSO₄) and evaporated *i.v.* The products were separated by chromatography (SiO₂, hexane/CH₂Cl₂; CC or prep. TLC (PLC)). Procedure 2: To the solution of **1**, **8** or **10** (*ca.* 1 mmol) and oxirane (*S*)-**2** or (*R*)-**6** (*ca.* 2 mmol) in dry CH₂Cl₂ (10-15 mL) under N₂ atmosphere, 4.5 g of silica gel were added at rt. After stirring the suspension for 10-72 h at rt, the mixture was filtered and the residue was washed with CH₂Cl₂ (4×). Then, the combined filtrate was evaporated *i.v.* The products were separated as described above.

Reactions of 1. – With (*S*)-2-methyloxirane ((*S*)-**2**). Reaction of **1** (204 mg, 1 mmol) with (*S*)-**2** (116 mg, 2 mmol) and 0.5 mmol of BF₃·Et₂O (or 4.5 g of SiO₂), at -60°C (or rt), and CC (hexane/CH₂Cl₂ 10:1) yielded (*S*)-1,1,3,3-tetramethyl-5'-methylspiro[indane-2,2'-[1,3]oxathiolane] ((*S*)-**3**), (*R*)-1,1,3,3-tetramethyl-4'-methylspiro[indane-2,2'-[1,3]oxathiolane] ((*R*)-**4**), and 1,1,3,3-tetramethylindan-2-one (**5**).⁵ In addition, the starting material (**1**) was partly recovered (see *Table 1*).

With (*R*)-2-phenyloxirane ((*R*)-**6**). Reaction of **1** (204 mg, 1 mmol) with (*R*)-**6** (300 mg, 2.5 mmol) and 0.5 mmol of BF₃·Et₂O (or SnCl₄, ZnCl₂), or 4.5 g of SiO₂, at different temperatures, CC (hexane/CH₂Cl₂ 10:1) and PLC yielded (*S*)-1,1,3,3-tetramethyl-4'-phenylspiro[indane-2,2'-[1,3]oxathiolane] ((*S*)-**7**) and **5**.⁵ The starting material (**1**) was mainly recovered (see *Table 2*).

Reaction of 8 with (R)-6. Reaction of **8** (50 mg, 0.23 mmol) with (*R*)-**6** (54 mg, 0.45 mmol) and 2.26 g of SiO₂ at rt and PLC (hexane/ether 20:1) yielded (5*S*,8*S*)-4,4-dimethyl-2,8-diphenyl-6-oxa-1,9-dithia-3-azaspiro[4.4]non-2-ene ((5*S*,8*S*)-**9**, [α]_D²³ = +26.7°), and (5*R*,8*S*)-4,4-dimethyl-2,8-diphenyl-6-oxa-1,9-dithia-3-azaspiro[4.4]non-2-ene ((5*R*,8*S*)-**9**) (see ref.⁶). In addition, 26 and 30%, respectively, of the starting material (**8**) were recovered (see *Scheme 4*).

Epimerization of (5*S*,8*S*)-9 to (5*R*,8*S*)-9. Treatment of (5*S*,8*S*)-**9** (32 mg, 0.09 mmol) with 3 drops of conc. HCl in CH₂Cl₂ (3 mL) at rt, 3 days, and prep. TLC (hexane/Et₂O 20:1) yielded 1 mg (3%) of (5*R*,8*S*)-**9**, and 8 mg (25%) of (5*S*,8*S*)-**9** was recovered.

Reactions of 10. – With (*S*)-**2**. Reaction of **10** (166 mg, 1 mmol) with (*S*)-**2** (116 mg, 2 mmol) in the presence of 4.5 g of SiO₂ at rt, 12 h, and CC (hexane/CH₂Cl₂ 10:1) yielded 61 mg (27%) of (*S*)-**11** and 4 mg (2%) of (*R*)-**12**, and 47 mg (28%) of the starting material (**10**) was recovered (see *Scheme 5*).

(*S*)-5'-Methylspiro[tricyclo[3.3.1.1^{3,7}]decane-2,2'-[1,3]oxathiolane] ((*S*)-**11**). Colorless oil. $[\alpha]_D^{23} = +37.7^\circ$. CI-MS (NH₃): 277 (7), 271 (35, [M+H]⁺), 169 (11), 168 (100), 164 (6). Anal. Calcd for C₁₈H₂₂O₂: C, 79.96; H, 8.20. Found: C, 79.77; H, 8.17.

X-Ray Crystal Structure Determination of (S)-13 (see Table 4 and Figure 1).¹⁰ All measurements were made on a *Nonius KappaCCD* diffractometer¹¹ using graphite-monochromated MoK_α

Table 4. *Crystallographic Data of Compound ((S)-13)*

Crystallised from	CH_2Cl_2 / i-PrOH
Empirical formula	$\text{C}_{18}\text{H}_{22}\text{OS}$
Formula weight [g mol^{-1}]	286.43
Crystal color, habit	colorless, needle
Crystal dimensions [mm]	$0.02 \times 0.10 \times 0.20$
Temperature [K]	160(1)
Crystal system	orthorhombic
Space group	$P2_12_12_1$
Z	4
Reflections for cell determination	1550
2θ range for cell determination [$^\circ$]	4-50
Unit cell parameters a [$\text{\AA}$]	8.7970(3)
b [$\text{\AA}$]	10.6973(3)
c [$\text{\AA}$]	15.8944(6)
V [$\text{\AA}^3$]	1495.73(9)
D_x [g cm^{-3}]	1.272
$\mu(\text{MoK}_\alpha)$ [mm^{-1}]	0.210
$2\theta_{(\text{max})}$ [$^\circ$]	50
Total reflections measured	20980
Symmetry independent reflections	2642
Reflections used [$I > 2\sigma(I)$]	2372
Parameters refined	183
Final R , wR	0.0387, 0.0369
Weights: p in $w = [\sigma^2(F_o) + (pF_o)^2]^{-1}$	0.005
Goodness of fit	2.152
Secondary extinction coefficient	$2.2(2) \times 10^{-6}$
Final $\Delta_{\text{max}}/\sigma$	0.0006
$\Delta\rho$ (max; min) [$\text{e \AA}^{-3}$]	0.21; -0.20

radiation (λ 0.71073 Å) and with an *Oxford Cryosystems Cryostream 700* cooler. The data collection and refinement parameters are given in *Table 4*, and a view of the molecule is shown in *Figure 1*. Data reduction was performed with *HKL Denzo* and *Scalepack*.¹² The intensities were corrected for Lorentz and polarization effects, but not for absorption. The structure was solved by direct methods using *SIR92*,¹³ which revealed the positions of all non-hydrogen atoms. The non-hydrogen atoms were refined anisotropically. All of the H-atoms were fixed in geometrically calculated positions [$d(\text{C-H}) = 0.95$ Å] and each was assigned a fixed isotropic displacement parameter with a value equal to $1.2U_{\text{eq}}$ of its parent C-atom. Refinement of the structure was carried out on F using full-matrix least-squares procedures, which minimised the function $\sum w(|F_{\text{O}}| - |F_{\text{C}}|)^2$. A correction for secondary extinction was applied. Refinement of the absolute structure parameter¹⁴ yielded a value of 0.01(5), which confidently confirms that the refined coordinates represent the true enantiomorph. Neutral atom scattering factors for non-hydrogen atoms were taken from ref.,^{15a} and the scattering factors for H-atoms were taken from ref.¹⁶ Anomalous dispersion effects were included in F_{C} ;¹⁷ the values for f' and f'' were those of ref.^{15b} The values of the mass attenuation coefficients are those of ref.^{15c} All calculations were performed using the *teXsan* crystallographic software package.¹⁸

ACKNOWLEDGMENTS

We thank the analytical services of our institute for NMR and mass spectra and elemental analyses, Miss *J. Cavegn* for her assistance with the determination of the crystal structure and the *Swiss National Science Foundation* and *F. Hoffmann-La Roche AG*, Basel, for financial support.
